## *Penco Phosphatizing...for a beautifully permanent finish.*

All Penco steel products receive a pre-paint conditioning treatment that begins with a thorough hot-spray cleaning process. Next, a coating of phosphate film is applied to the steel to improve resistance to corrosion and enhance paint bond. Once done, premium quality custom blended enamel is applied by one of the industry's most efficient electrostatic painting systems. The final step occurs in a continuous curing oven that assures superior paint adhesion, a high degree of paint permanence and an attractive surface smoothness.
